Asthma-Related Emergency Department Visits and Hospitalization among the Children under Age 18 in Miami-Dade County, 2007-2012

Kathleen Ochipa, BS, MS, Guoyan Zhang, MD, MPH

Introduction

Asthma is one of the most common chronic pediatric diseases in the United States, affecting about 7 million children, and also common among adults- affecting 18.7 million adults. Each year asthma accounts for about 439,000 hospitalizations, 1.8 million emergency department visits, and more than 3,404 deaths nationwide. In the US the asthma prevalence rate increased from 7.3% in 2001 to 8.4% in 2010. Asthma prevalence is higher among children, females, blacks and multi-race persons, and those with family income below poverty. The purpose of this report is to describe asthma related Emergency Department (ED) visits and hospitalizations among children under age 18 with focus on demographic and geographic characteristics in Miami-Dade County between 2007 and 2012.

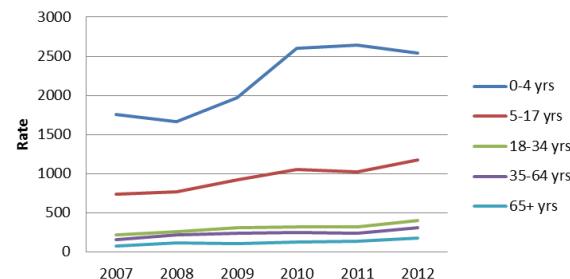

Methodology

The data for emergency department visits and hospital discharges was obtained from Florida Agency for Health Care Administration (AHCA). The data presented are for “asthma as principal diagnosis” of the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) code 493. SAS 9.3 and ArcGIS 10 were employed to analyze the data.

Results

Annually, there were around 12,000 and 4,500 asthma related ED visits and hospitalizations; 66% and 25% of them were children aged 0-17 years, respectively. Children, compared to other age groups, tend to have the highest rates of ED utilization for asthma. Children aged 0-4 years have the highest rate followed by the 5-17 years age group. Additionally, asthma related ED visit rates among children aged 0-4 and 5-17 years have increased from 1,763 and 741 in 2007 to 2,563 and 1,180 per 100,000 children in 2012, respectively. The asthma related ED visit rates slightly increased among all other age groups between 2007 and 2012 (Figure-1).

Figure-1 ED Visit Rate per 100,000 Population by Age Group, Miami-Dade County, 2007-2012

A substantial disparity in asthma related ED visits exists with race/ethnicity. Among the children aged 0-4 and 5-17 years, Non-Hispanic Blacks had the highest asthma related ED visit rate followed by Hispanic children (Figure-2 & 3).

Figure-2 ED Visits per 100,000 Children Aged 0-4 years, Miami-Dade County, 2007-2012

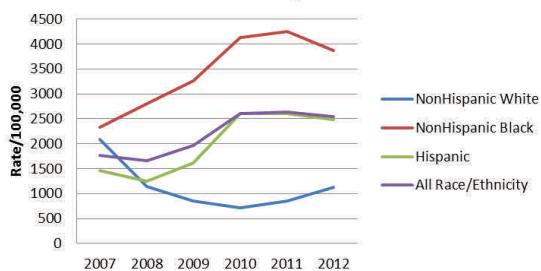

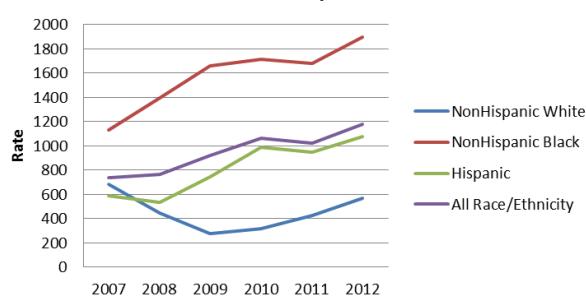

Figure-3 ED Visits per 100,000 Children Aged 5-17 years Miami-Dade County, 2007-2012

Male children aged 0-4 had significantly higher emergency department visit rates for asthma compared to female children (1,525 vs. 939), but with age, the ED visit rate was higher among females compared to males (Figure-4). The median cost per ED visit has progressively increased from about 1,007 for 0-4 year olds and 1,078 for 5-17 year olds in 2007 to 1,552 and 1,663 in 2012, respectively (Figure-5). More than 76% of children with asthma related ED visits were covered by Medicaid or Medicaid Managed Care or KidCare, 15% of them were covered by commercial insurance, and 6% of them were self-payer.

Figure-4 ED Visits per 100,000 Population by Age and Sex, Miami-Dade County, 2007-2012

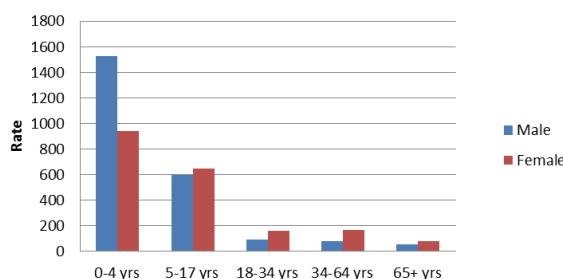

Figure-5 Median Cost (US Dollars) of ED Visit due to Asthma among Children, Miami-Dade County 2007-2012

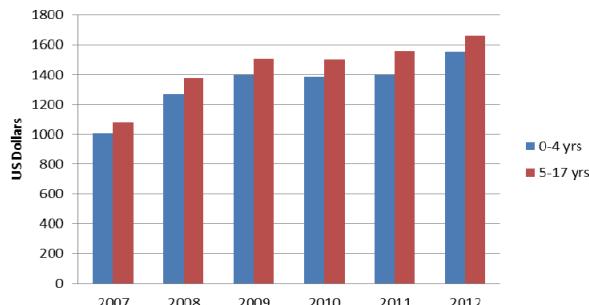

Figure-6 Hospitalization Rate per 100,000 Population by Age Group, Miami-Dade County, 2007-2012

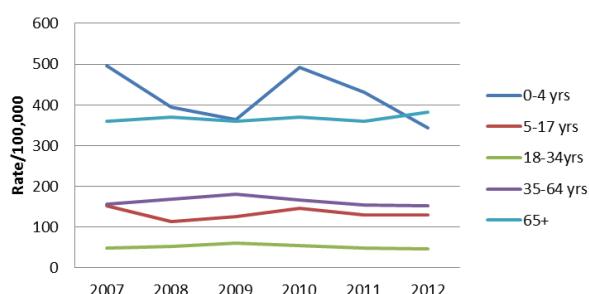

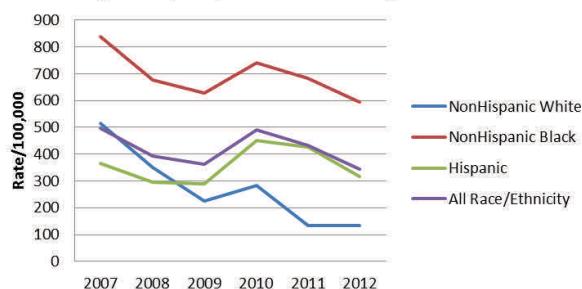

Figure-6 displays the rate of hospitalization for asthma by age group between 2007 and 2012. The highest rates for asthma are found in children 0-4 years followed by elderly adults 65 and older. The young adults aged 18-34 years had the lowest rate. The asthma related hospitalization rates decreased from 496 and 152 in 2007 to 343 and 129 in 2012 among children aged 0-4 years and 5-17 years respectively (Figure-6). The Non-Hispanic Black children aged 0-4 and 5-17 years had highest hospitalization rate for Asthma during 2007-2012 (Figure-7 & 8).

Figure-8 Hospitalization Rate per 100,000 Children Aged 5-17 years, Miami-Dade County, 2007-2012

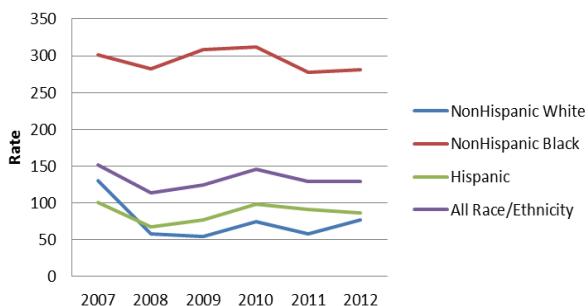

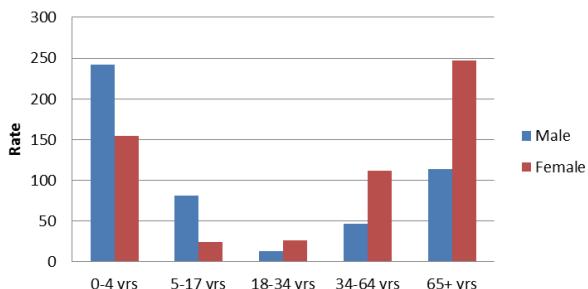

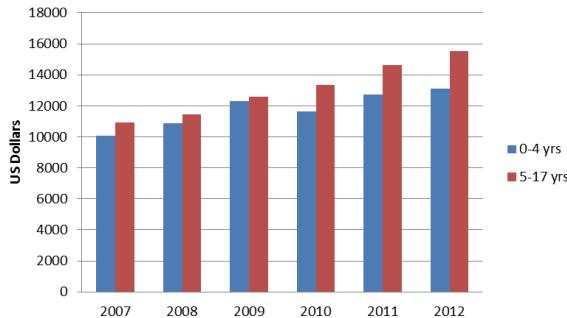

Figure-9 shows a crossover of asthma hospitalization rates by age and gender, in children more males are hospitalized for asthma, however in adults, more females are hospitalized for asthma. While the median days of hospitalization due to Asthma among children in Miami-Dade has remained the same (2 days) from 2007-2012, the median cost of hospitalization has progressively increased from about 10,047 for 0-4 year olds and 10,902 for 5-17 year olds in 2007 to 13,117 and 15,536, respectively (Figure-9). Seventy percent of children with asthma related hospitalization were covered by Medicaid or Medicaid Managed Care or KidCare, 27% of them were covered by commercial insurance, and 2% of them were self-payer.

**Figure-10 Median Cost (US Dollars) of Hospitalization due to
Asthma among Children, Miami-Dade County 2007-2012**

Asthma related ED visit and hospitalization rates vary greatly by geographic area of the county. Maps depicting the ED visit and hospitalization rates of children aged 0-17 by zip code indicate the greatest incidence in the north corridor and far south of Miami-Dade County. In the southern part of the county, however, there were several zip codes with hospitalization rates higher than 240 per 100,000 (Map-1 & Map-2).

Discussion

In Miami-Dade County, children aged 0-4 years, compared to other age groups, tend to have the highest rates of emergency department visits for asthma followed by children aged 5-17. And, children aged 0-4 years had higher hospitalization rates compared to other age group during 2007-2012. Non-Hispanic Blacks had the most striking disparity in the burden of asthma compared to non-Hispanic Whites.

Compared to the State of Florida's average level in 2011, Asthma related emergency room visit and hospitalization crude rates per 100,000 population are higher in Miami-Dade County (511 vs. 471 and 172 vs. 157 respectively). Among children aged 0-4, the 2011 Asthma related emergency room visit and hospitalization rates per 100,000 are 2,643 and 432 in Miami-Dade County, higher than Florida's average level of 1,687 and 396, respectively.

Asthma is a significant public health problem in Miami-Dade County, varying greatly by geographic area of the County.

Asthma related emergency department visits and hospitalizations are indicators of uncontrolled asthma. Asthma morbidity can be measured by the number of visits asthma sufferers make to the emergency department and/or hospitalization; these measures indicate the true burden of asthma for individuals whose condition is poorly controlled. The financial burden of asthma is considered preventable because many ED visits and some hospitalizations can be avoided with better access to primary care physicians, preventive medicine, and health education.

Asthma can be a life-threatening disease if not properly managed. Patient education is vital for those who suffer from asthma. Asthma control programs help the community to achieve better health and improved quality of life and to reduce the overall hardship that asthma puts on the workforce, healthcare system, and communities. Control programs can reduce hospitalizations, ED Visits and their associated costs. The Florida Department of Health in Miami-Dade County will continue to assess and monitor asthma prevalence in order to help guide future prevention efforts.

Influenza-Like-Illness, All Age

During this period, there were 22,112 ED visits; among them 583 (2.6%) were ILI. At the same week of last year, 2.8% of ED visits were ILI.

PARTICIPATE IN INFLUENZA SENTINEL PROVIDER SURVEILLANCE

Florida Department of Health in Miami-Dade County NEEDS Influenza Sentinel Providers!

Sentinel providers are key to the success of the Florida Department of Health's Influenza Surveillance System. Data reported by sentinel providers gives a picture of the influenza virus and ILI activity in the U.S. and Florida which can be used to guide prevention and control activities, vaccine strain selection, and patient care.

- Providers of any specialty, in any type of practice, are eligible to be sentinel providers.
- Most providers report that it takes **less than 30 minutes a week** to compile and report data on the total number of patients seen and the number of patients seen with influenza-like illness.
- Sentinel providers can submit specimens from a subset of patients to the state laboratory for virus isolation **free of charge**.
